The composition of the Zn-Li silicates reported by us (Yu et al., 1978) has been questioned by West (1979) who suggests a composition closer to Li<sub>1.6</sub>Zn<sub>1.2</sub>SiO<sub>4</sub>. The arguments raised by West require some clarification.

- (1) West identified our  $\beta$ ,  $\alpha$ , and  $\alpha'$  as  $\gamma_{11}$ ,  $\gamma_0$ , and C respectively. West's three phases differ in composition while our  $\beta$ ,  $\alpha$ , and  $\alpha'$  all have essentially the same composition. In addition, our  $\alpha'$  is not a single phase but a twinned state of the  $\alpha$  form at the atomic scale (Table 1).
- (2) West claimed that the powder pattern of our  $\alpha$  phase corresponds fairly well to  $\gamma_0$  (West and Glasser, 1970) except that the latter has more lines. The two patterns are compared in Table 2 and Figure 1, and it is self-evident that they do not match "fairly well" as claimed. West also mentioned that the larger number of lines observed for  $\gamma_0$  is probably because a high resolution focusing camera was used in West and Glasser's work to record the powder pattern. As a matter of fact, we also used the focusing camera (Guinier camera) in obtaining our X-ray pattern.
  - (3) West's atomic coordinates of Li<sub>3</sub>PO<sub>4</sub> are identi-

cal to those of our Zn-Li silicates except that the former has an extra Li atom. If this extra Li atom in Zemann's Li<sub>3</sub>PO<sub>4</sub> (Zemann, 1960) is ignored, it appears that these two structures are similar.

(4) The measured and the calculated density for our Zn-Li silicates are, respectively, 3.53 and 3.51 g/cm<sup>3</sup>. If West's composition were adopted, the calculated density would be 3.61 g/cm<sup>3</sup>, which is slightly too high when compared with the experimental value.

In view of the above discussion we conclude that our Zn-Li silicate appears to be a distinct phase from those reported by West. However, we appreciate West's interest and comments, and his calling to our attention to some of his valuable work on Zn-Li silicates which we did overlook in our literature review.
