Polymorphism & Series: Forms a series with sicklerite.

Occurrence: Formed by late hydrothermal alteration or weathering of triphylite-lithiophilite in complex zoned granite pegmatites.

Association: Triphylite-lithiophilite, heterosite, alluaudite, phosphosiderite, cyrilovite.

Distribution: In Sweden, from the Varuträsk pegmatite, 15 km northwest of Skellefteå, Västerbotten; at the Norrö pegmatite, on Rånö Island, and on Utö Island. At Tammela, Finland. From Hühnerkobel, near Zwiesel, and crystallized from Hagendorf, Bavaria, Germany. From pegmatites around Sidi Bou Othmane, Jebilet, and the Angarf-Sud pegmatite, Tazenakht Plain, Anti-Atlas Mountains, Morocco. At the Souchon pegmatite, Lamativi, and Portree mine, Odzi, Zimbabwe. In the Buranga pegmatite, Gatumba district, Rwanda. From the Tsaobismund pegmatite, 60 km south of Karibib, Namibia. In the USA, from Strafford and Rochester, Strafford Co., and in the Palermo #1 mine, near North Groton, Grafton Co., New Hampshire; from Newry and Paris, Oxford Co., Maine; in the Tip Top mine, 8.5 km southwest of Custer, Custer Co., South Dakota; from the Foote mine, near Kings Mountain, Cleveland Co., North Carolina. Probably present at many other pegmatites.

Name: For its dominant ferric iron content and relation to sicklerite.
