

**Trimerite**

©2001 Mineral Data Publishing, version 1.2

**Crystal Data:** Monoclinic. *Point Group:* 2/m. Crystals prismatic, pseudohexagonal by twinning, to 12 mm; as crystal intergrowths. *Twinning:* Triple twins with composition planes (110) and (1 $\bar{1}$ 0); in basal section, twin lamellae in three directions intersect at an angle of 120°.

**Physical Properties:** *Cleavage:* Distinct on {001}. *Fracture:* Conchoidal. *Tenacity:* Brittle. Hardness = 6–7 D(meas.) = 3.474 D(calc.) = 3.47

**Optical Properties:** Transparent to translucent. *Color:* Salmon-pink, pale yellowish red to nearly colorless; in thin section, colorless. *Luster:* Vitreous, brilliant.

*Optical Class:* Biaxial (−). *Orientation:*  $X \perp \{001\}$ . *Dispersion:* Perceptible.  $\alpha = 1.715$   $\beta = 1.720$   $\gamma = 1.725$   $2V(\text{meas.}) = 83^\circ$

**Cell Data:** *Space Group:* P2<sub>1</sub>/n.  $a = 8.098$   $b = 7.613$   $c = 14.065$   $\beta = 90^\circ$   $Z = 4$

**X-ray Powder Pattern:** Harstigen mine, Sweden. (ICDD 17-477).  
2.764 (100), 3.56 (40), 2.229 (35), 2.332 (30), 1.420 (30), 2.053 (25), 1.784 (25)

**Chemistry:**

	(1)	(2)
SiO <sub>2</sub>	39.77	39.77
FeO	3.87	
MnO	26.86	31.30
BeO	17.08	16.56
MgO	0.61	
CaO	12.44	12.37
Total	100.63	100.00

(1) Harstigen mine, Sweden. (2) CaMn<sub>2</sub>Be<sub>3</sub>(SiO<sub>4</sub>)<sub>3</sub>.

**Occurrence:** A rare mineral, probably formed during late-stage hydrothermal activity associated with contact metamorphism and metasomatism.

**Association:** Calcite, hematite.

**Distribution:** At the Harstigen mine, near Persberg, at Jakobsberg, and at Långban, Värmland, Sweden.

**Name:** From the Greek for *three parts*, in allusion to the trilling twinning and associated optical effects.
