Digital Camera DP70
12.5 MILLION PIXEL RESOLUTION

High Resolution & High Sensitivity Coupled With High-Speed Processing Position
The DP70 Digital Camera Out On Top

Specifications are subject to change without any obligation on the part of the manufacturer.

OLYMPUS

Olympus Business Areas

Image Processing

Olympus Optical Co., Ltd.
**Hardware**

**Rapid high-resolution image acquisition — 12.5 million pixels in only 3 seconds.**
High sensitivity, low noise design captures detailed low light fluorescence signals.

---

**Super-high resolution, 12.5 million pixel equivalent**
By shifting the 1.45 million pixel CCD, DP70 users can obtain still images at the maximum image resolution of 4096 X 3072 pixels. This results in an effective resolution equivalent to 12.5 million pixels — capturing accurate images of the specimen with remarkable clarity, detail, and color depth.

**Approximately 3 seconds...to capture a high-resolution image equivalent to 12.5 million pixels.**
Combining the most advanced Olympus technology used in digital cameras with high-speed image data transfer, the DP70 can capture an extremely high resolution image in only 3 seconds — eliminating delay and facilitating a smooth, uninterrupted workflow.

---

**Fast frame rate allows rapid previewing and easy focusing**
The DP70 displays live images (size: 680 X 512) at a fast 15 frames/sec* for quick, easy focusing and framing. With the camera’s high sensitivity and 2 X 2 or 4 X 4 binning functions, even dim fluorescence specimens are displayed clearly and sharply at fast frame rates.

*The speed will depend on the PC configuration.

---

**Olympus presents advanced, multi-function software to optimize real-time acquisition conditions and subsequent image management.**

**Image acquisition software**

**SFL (Super FL) automatic exposure mode for easy fluorescence image acquisition**
The DP70’s SFL automatic exposure mode calculates and sets the correct exposure time for fluorescence images using metering parameters based on advanced photomicrographic expertise. In addition, either automatic or manual exposure modes can be selected. The former sets the exposure and adjusts the image brightness automatically; great for a brightly illuminated stained specimen. Manual mode allows the user to select the preferred level of image brightness.

**Binning function (preview image)**
For low light level fluorescence signals, enable the DP70’s 2 X 2 or 4 X 4 binning function. Sensitivity is increased, allowing preview images to be displayed at an increased frame rate that is very effective for dim fluorescence specimens.

**Scale bar feature**
A scale bar superimposed on the image provides a valuable reference to approximate the specimen size. Simply enter the objective and relay magnification and the appropriate scale bar is generated.

---

**High-sensitivity, low-noise performance detects and captures images from low light fluorescence signals**
A CCD with high sensitivity was developed specially for the DP70. Cooled by means of a Peltier device, it delivers high sensitivity with low noise at an equivalent of ISO1600; enabling even faint fluorescence signals to be captured as detailed, informative images.

**Frame and clip a region of interest**
The user can clip a region of interest within the image window and save it separately. The size and position of the designated domain within the field of view can be designated without restriction.

---

**Image management software**

**Easy to view thumbnail display**
Simple, easy thumbnail display yields 4096 intensity values. This presents an image of the specimen image with smooth gradations in true, natural colors.

**Multiple image merging for fluorescence and DIC imaging**
Images from a specimen captured using multi-fluors and DIC can be combined to compose a single image. No other additional image processing software is required.

---

**Software**

**Sophisticated Performance**

**Specimens are represented in true color**
The data from each RGB color is captured with 12 bits of image information yielding 4096 intensity values. This presents an image of the specimen image with smooth gradations in true, natural colors.

---

**Hardware**

**Smart Operation**

**Full window image display for easy viewing**
One click on a tool bar button displays the full image area in the window. High image clarity is maintained at the new larger display size necessary for meetings and conferences. The center of the field of view can be enlarged up to 2X using the zoom mode.

Software

Olympus presents advanced, multi-function software to optimize real-time acquisition conditions and subsequent image management.

Image acquisition software

SFL (Super FL) automatic exposure mode for easy fluorescence image acquisition
The DP70’s SFL automatic exposure mode calculates and sets the correct exposure time for fluorescence images using metering parameters based on advanced photomicrographic expertise. In addition, either automatic or manual exposure modes can be selected. The former sets the exposure and adjusts the image brightness automatically; great for a brightly illuminated stained specimen. Manual mode allows the user to select the preferred level of image brightness.

Binning function (preview image)
For low level light fluorescence signals, enable the DP70’s 2 X 2 or 4 X 4 binning function. Sensitivity is increased, allowing preview images to be displayed at an increased frame rate that is very effective for dim fluorescence specimens.

Scale bar feature
A scale bar superimposed on the image provides a valuable reference to approximate the specimen size. Simply enter the objective and relay magnification and the appropriate scale bar is generated.

Image management software

Frame and clip a region of interest
The user can clip a region of interest within the image window and save it separately. The size and position of the designated domain within the field of view can be designated without restriction.

Full window image display for easy viewing
One click on a tool bar button displays the full image area in the window. High image clarity is maintained at the new larger display size necessary for meetings and conferences. The center of the field of view can be enlarged up to 2X using the zoom mode.

Easy to view thumbnail display
Stored images can be displayed simultaneously as thumbnails; size can be changed by pressing a button. Locating, selecting, and displaying an image is performed quickly.

Multiple image merging for fluorescence and DIC imaging
Images from a specimen captured using multi-fluors and DIC can be combined to compose a single image. No other additional image processing software is required.
Attachment adapter for IX microscopes / DP70-IFAD

This adapter enables the DP70 to be attached to the side ports of IX81, IX71, and IX51 inverted microscopes.
